

RANGE EXPANSION

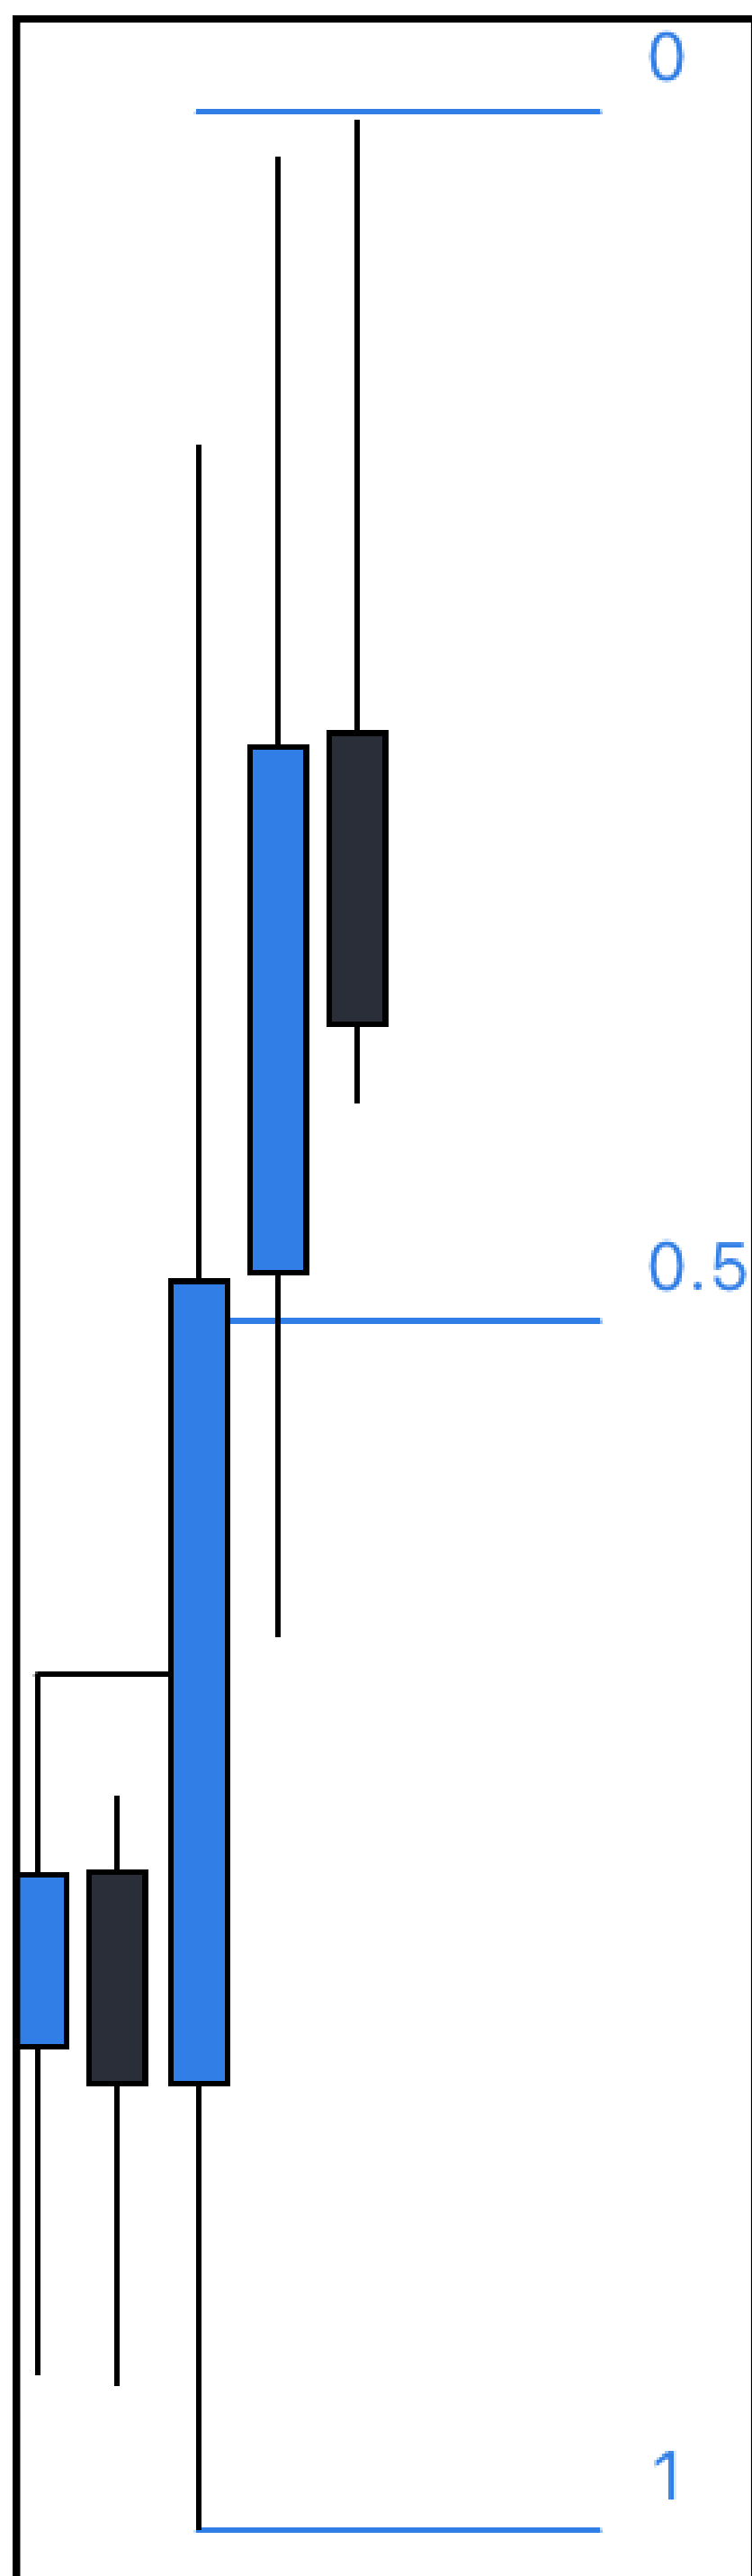

The Simplest ICT Strategy You'll Ever Find

STEP 1

Range Expansion Strategy

IMPULSE + FIB

WHAT IT IS

Impulse structure is any expansive move from one low to a high or vice versa. The price leg must push and close violently through a previous high or low to be considered an impulse

SIGNIFICANCE

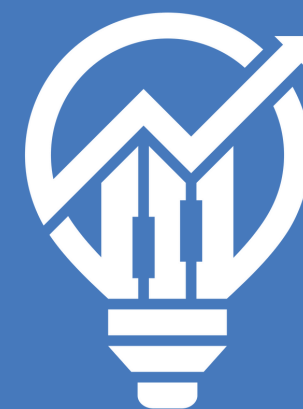

Impulse structure tells the overall direction of the market. A clear displacement is key to determining the true flow of the market and which side (buyers or sellers) is in charge.

APPLICATION

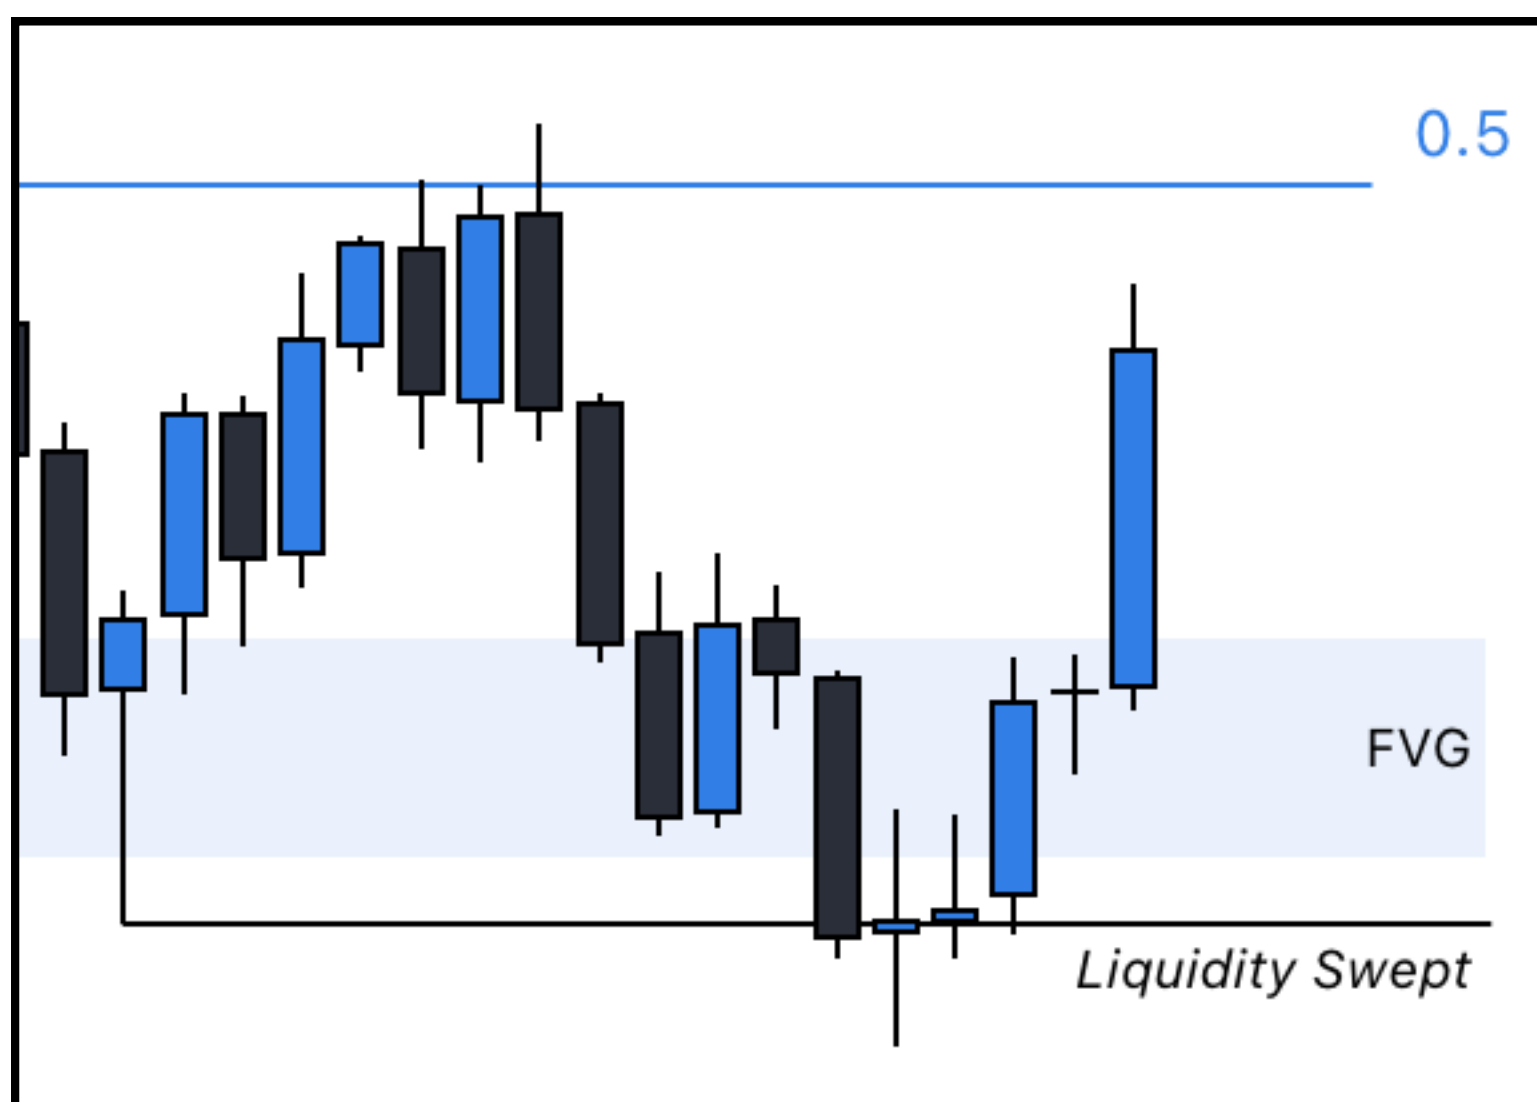

In order to frame a high probability trade setup using the range expansion strategy, you must use discount and premium. Discount for buys, and premium for sells. Only buy in bullish impulses, and only sell in bearish ones. Discount prices are under the 0.5 of the range, and premium prices are above it. You can use a fib tool in your charting software to plot this on any leg in price. This is the first step to framing a trade using this strategy.

STEP 2

Range Expansion Strategy

LTF SWEEP + REJECT

WHAT IT IS

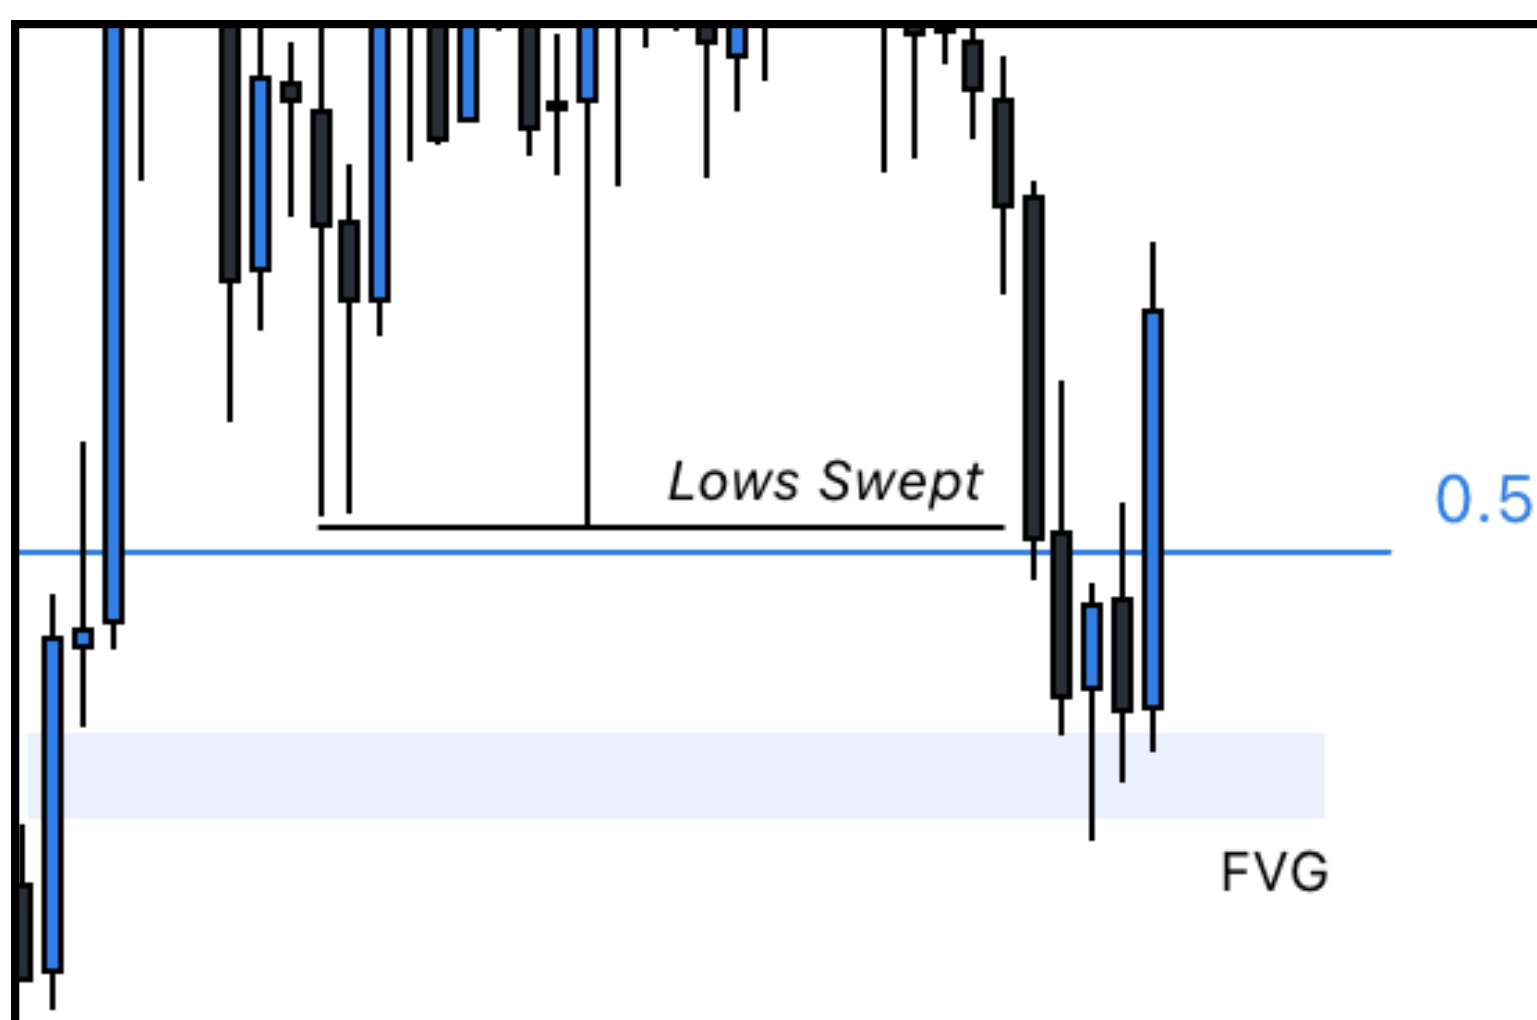

Switch to the lower time frame and wait for liquidity to be formed around discount or premium pricing. Lows for buys, highs for sells. Once swept, watch for rejection to enter a trade

SIGNIFICANCE

We expect price to continue in the direction of the higher timeframe impulse, and we use the lower time frames to give an early signal of when this will happen. Price reacting to liquidity tells us that the market is ready to move.

APPLICATION

Once price has swept the lows into a discount for buys, or swept highs into premium for sells, a trade entry begins to form. To confirm our entry, we want to see a violent reaction from the liquidity. This tells us that the impulse is indeed likely to continue. Probability increases if price is also trading into a FVG prior to the reversal. A trick you can use is the high/low swept. If the candle that signifies reversal pushes violently back through this level, probability increases.

STEP 3

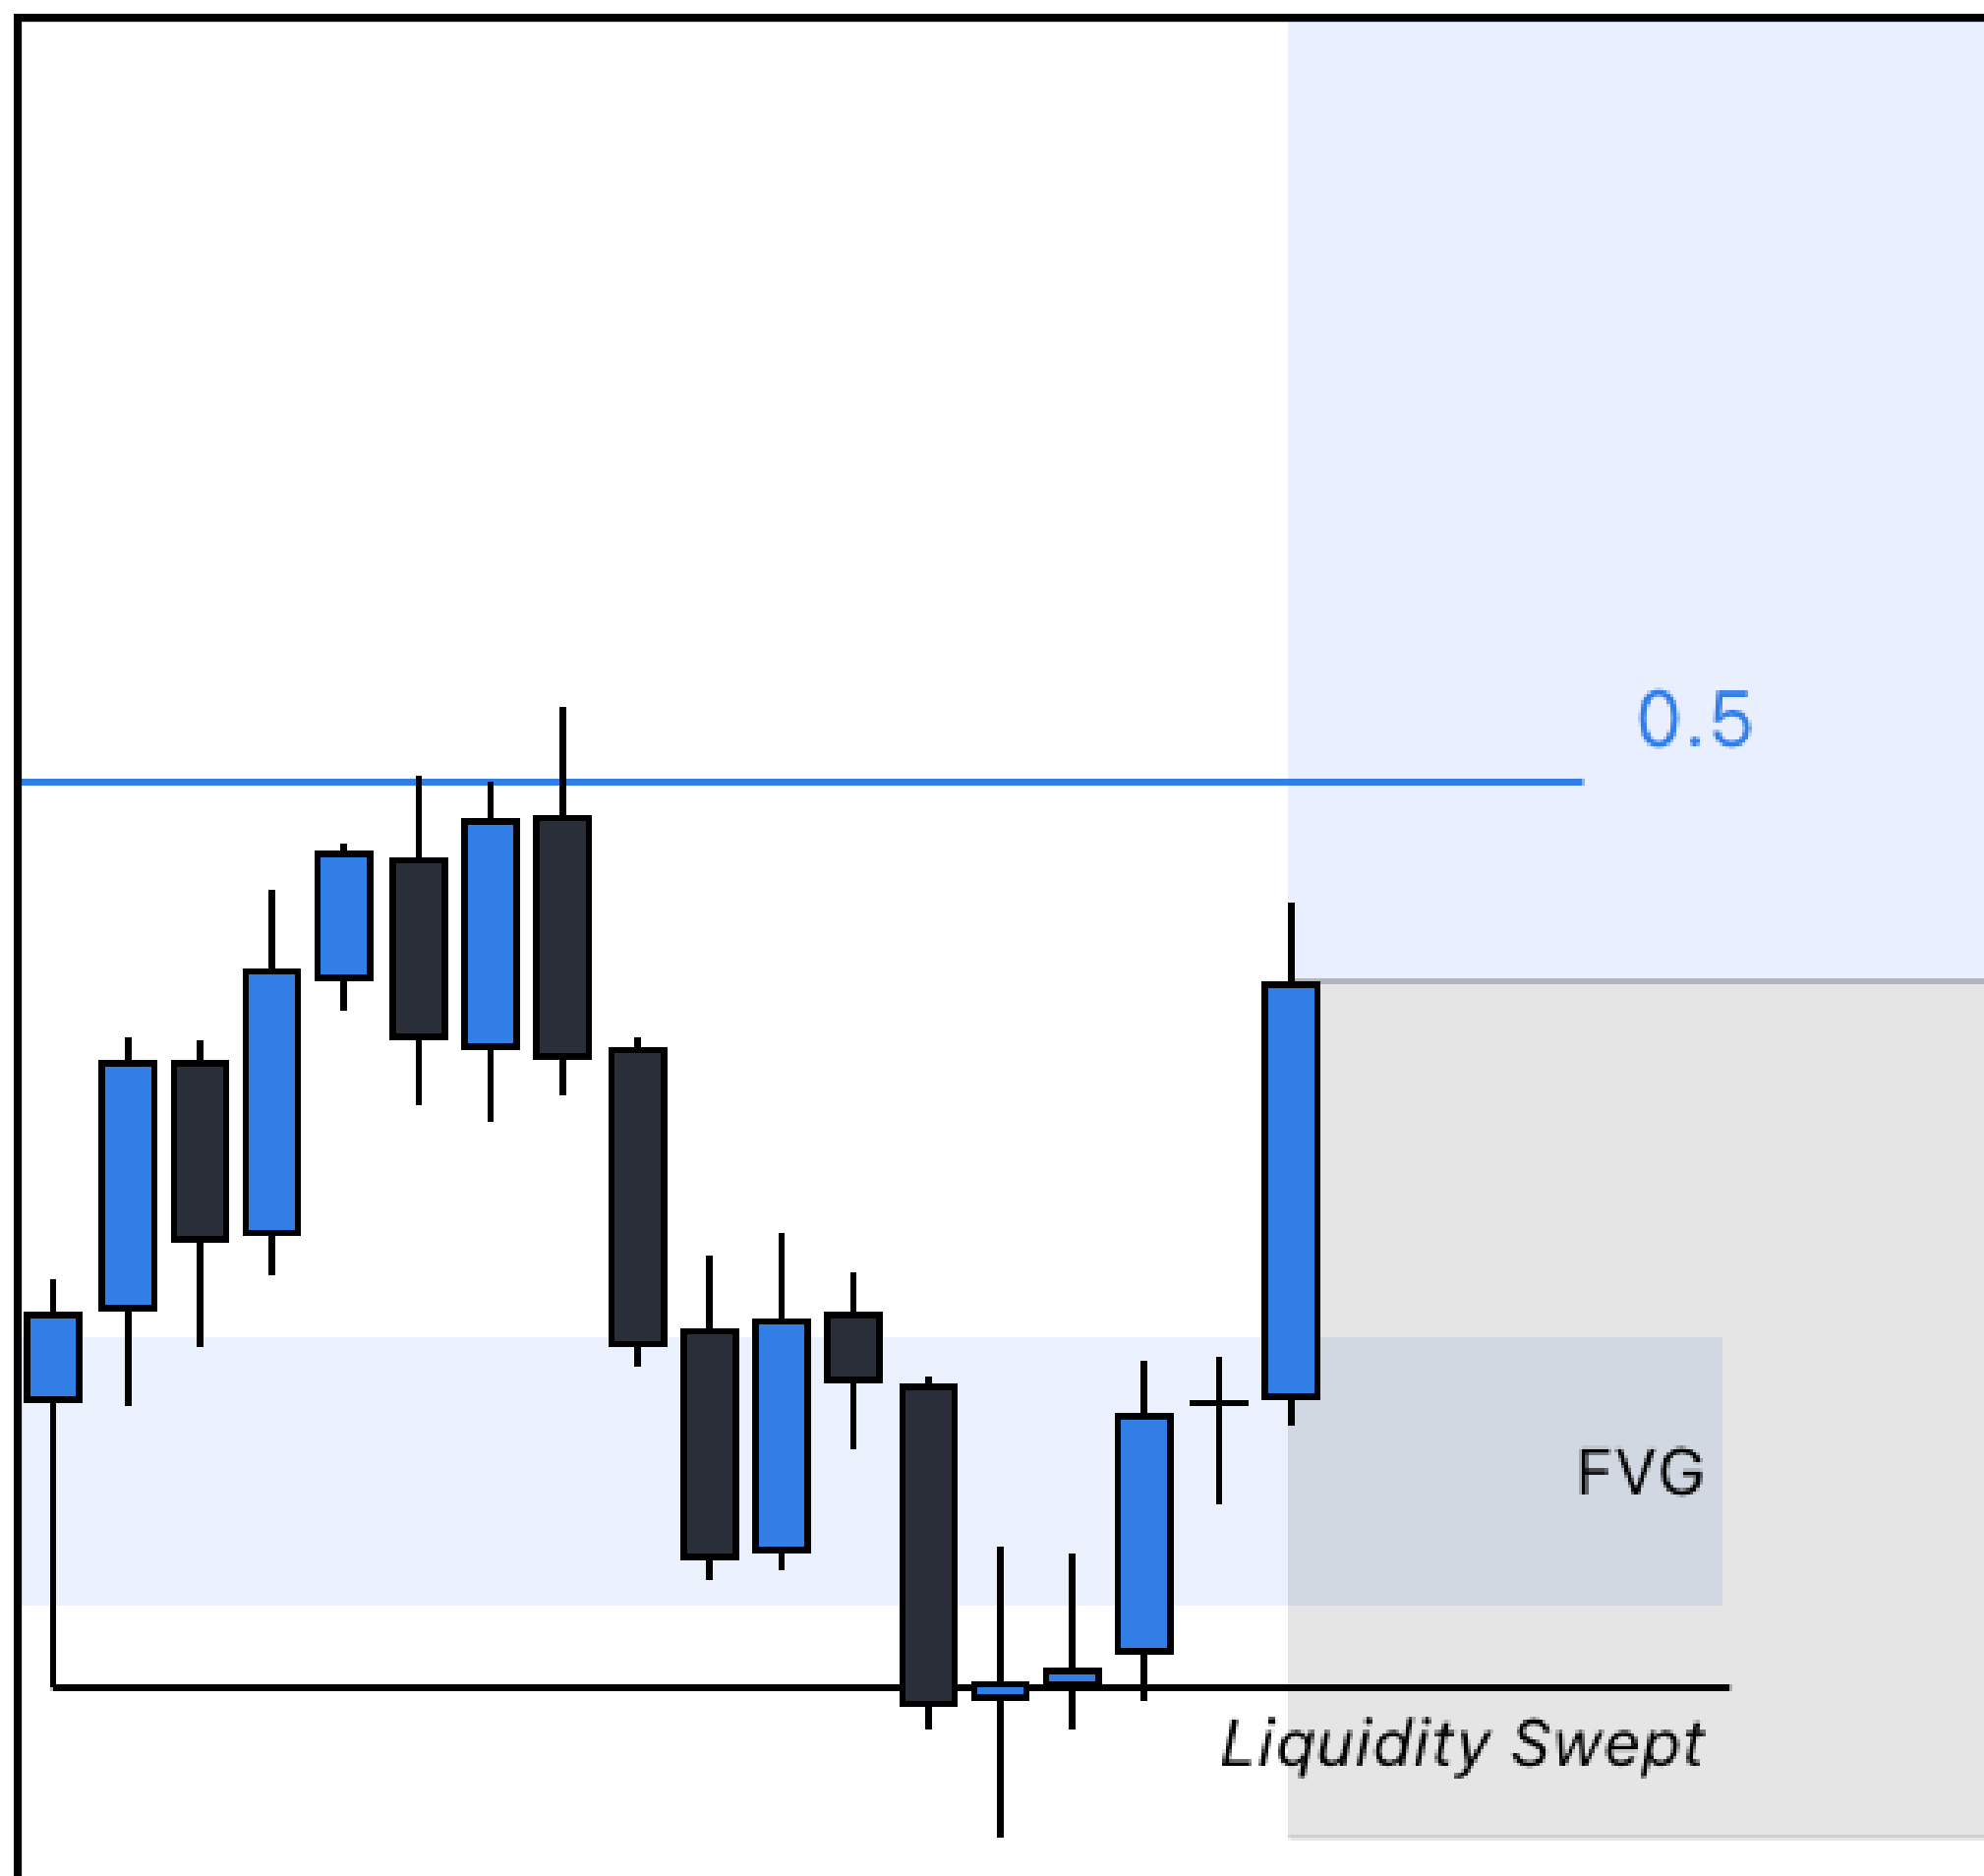

Range Expansion Strategy

ENTRY

Once you get either a market structure shift, a change in the state of delivery, or a failure to displace at the liquidity, you can enter the trade with a stop loss at the low/high made during the liquidity sweep.

Your target will be derived from the higher time frame, which will be depicted on the next page

STEP 3

Range Expansion Strategy

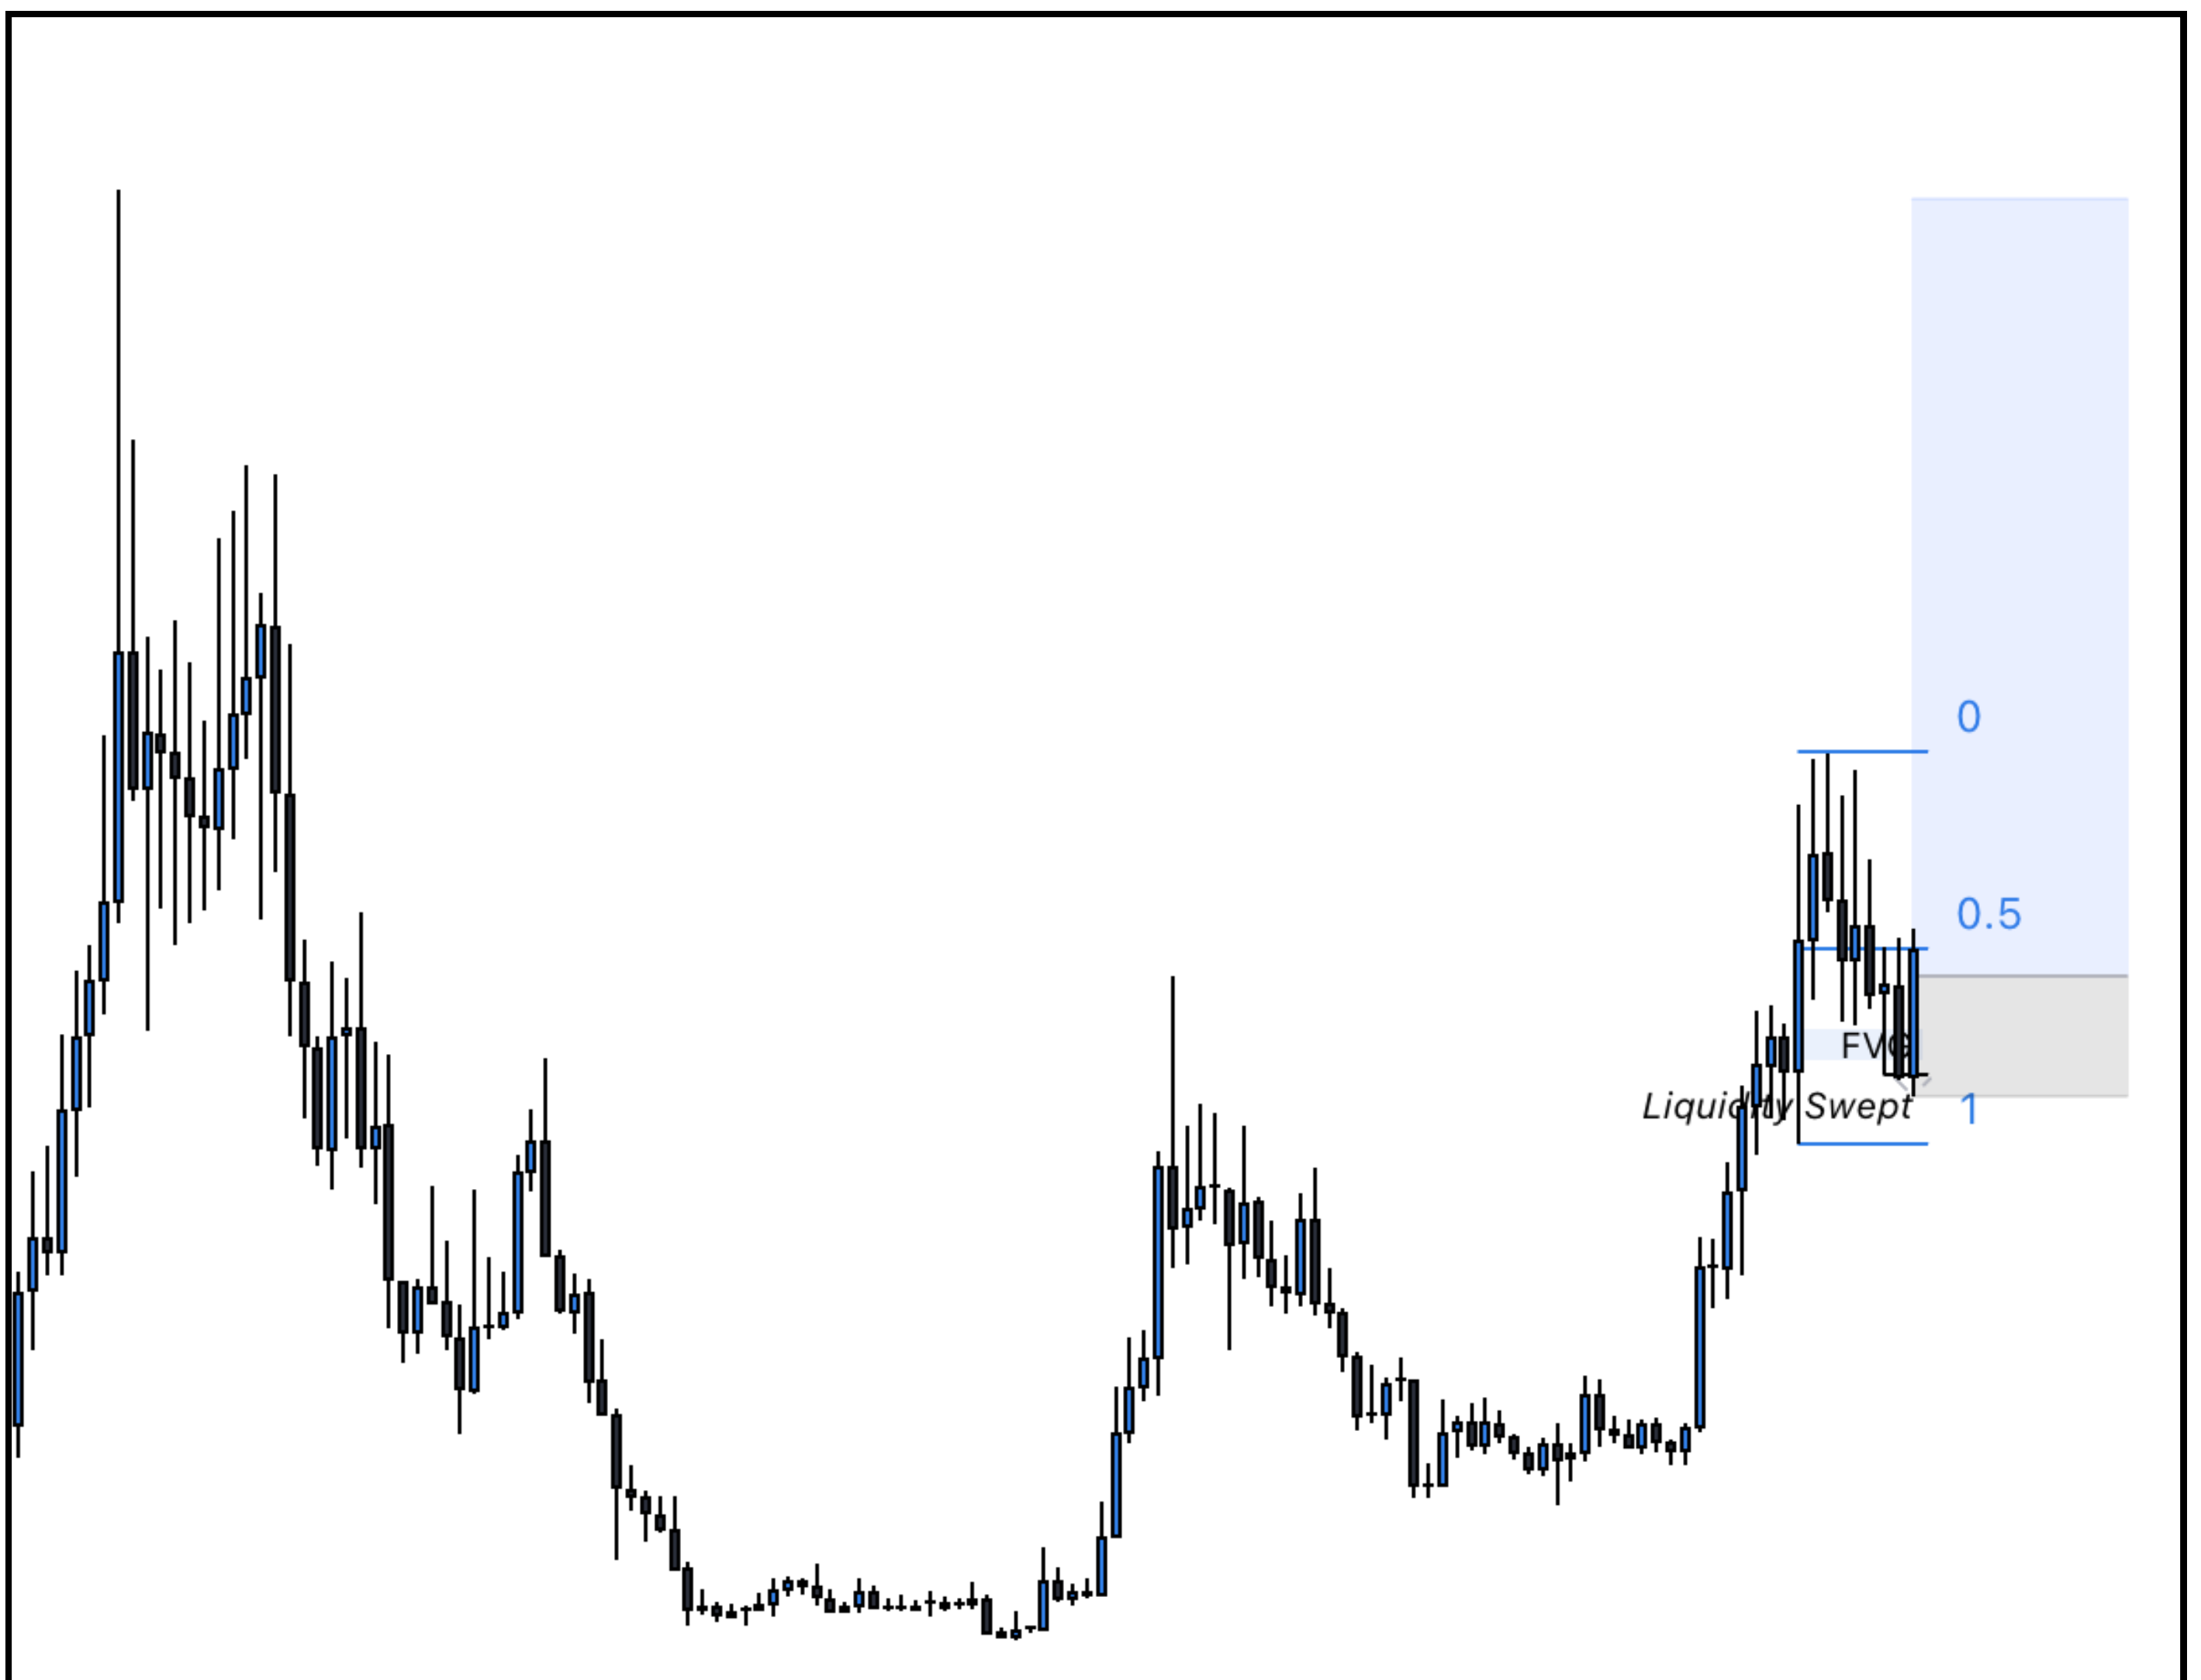

TARGETING

To find your target you will be using the HTF that you originally found the impulse on.

You will look for a market maker model, which is pictured below. A market maker model is a series of 3 consolidations moving into a key level, and when the market reverses, you will look for the original consolidation to be taken out.

See the next page for a diagram

STEP 3

Range Expansion Strategy

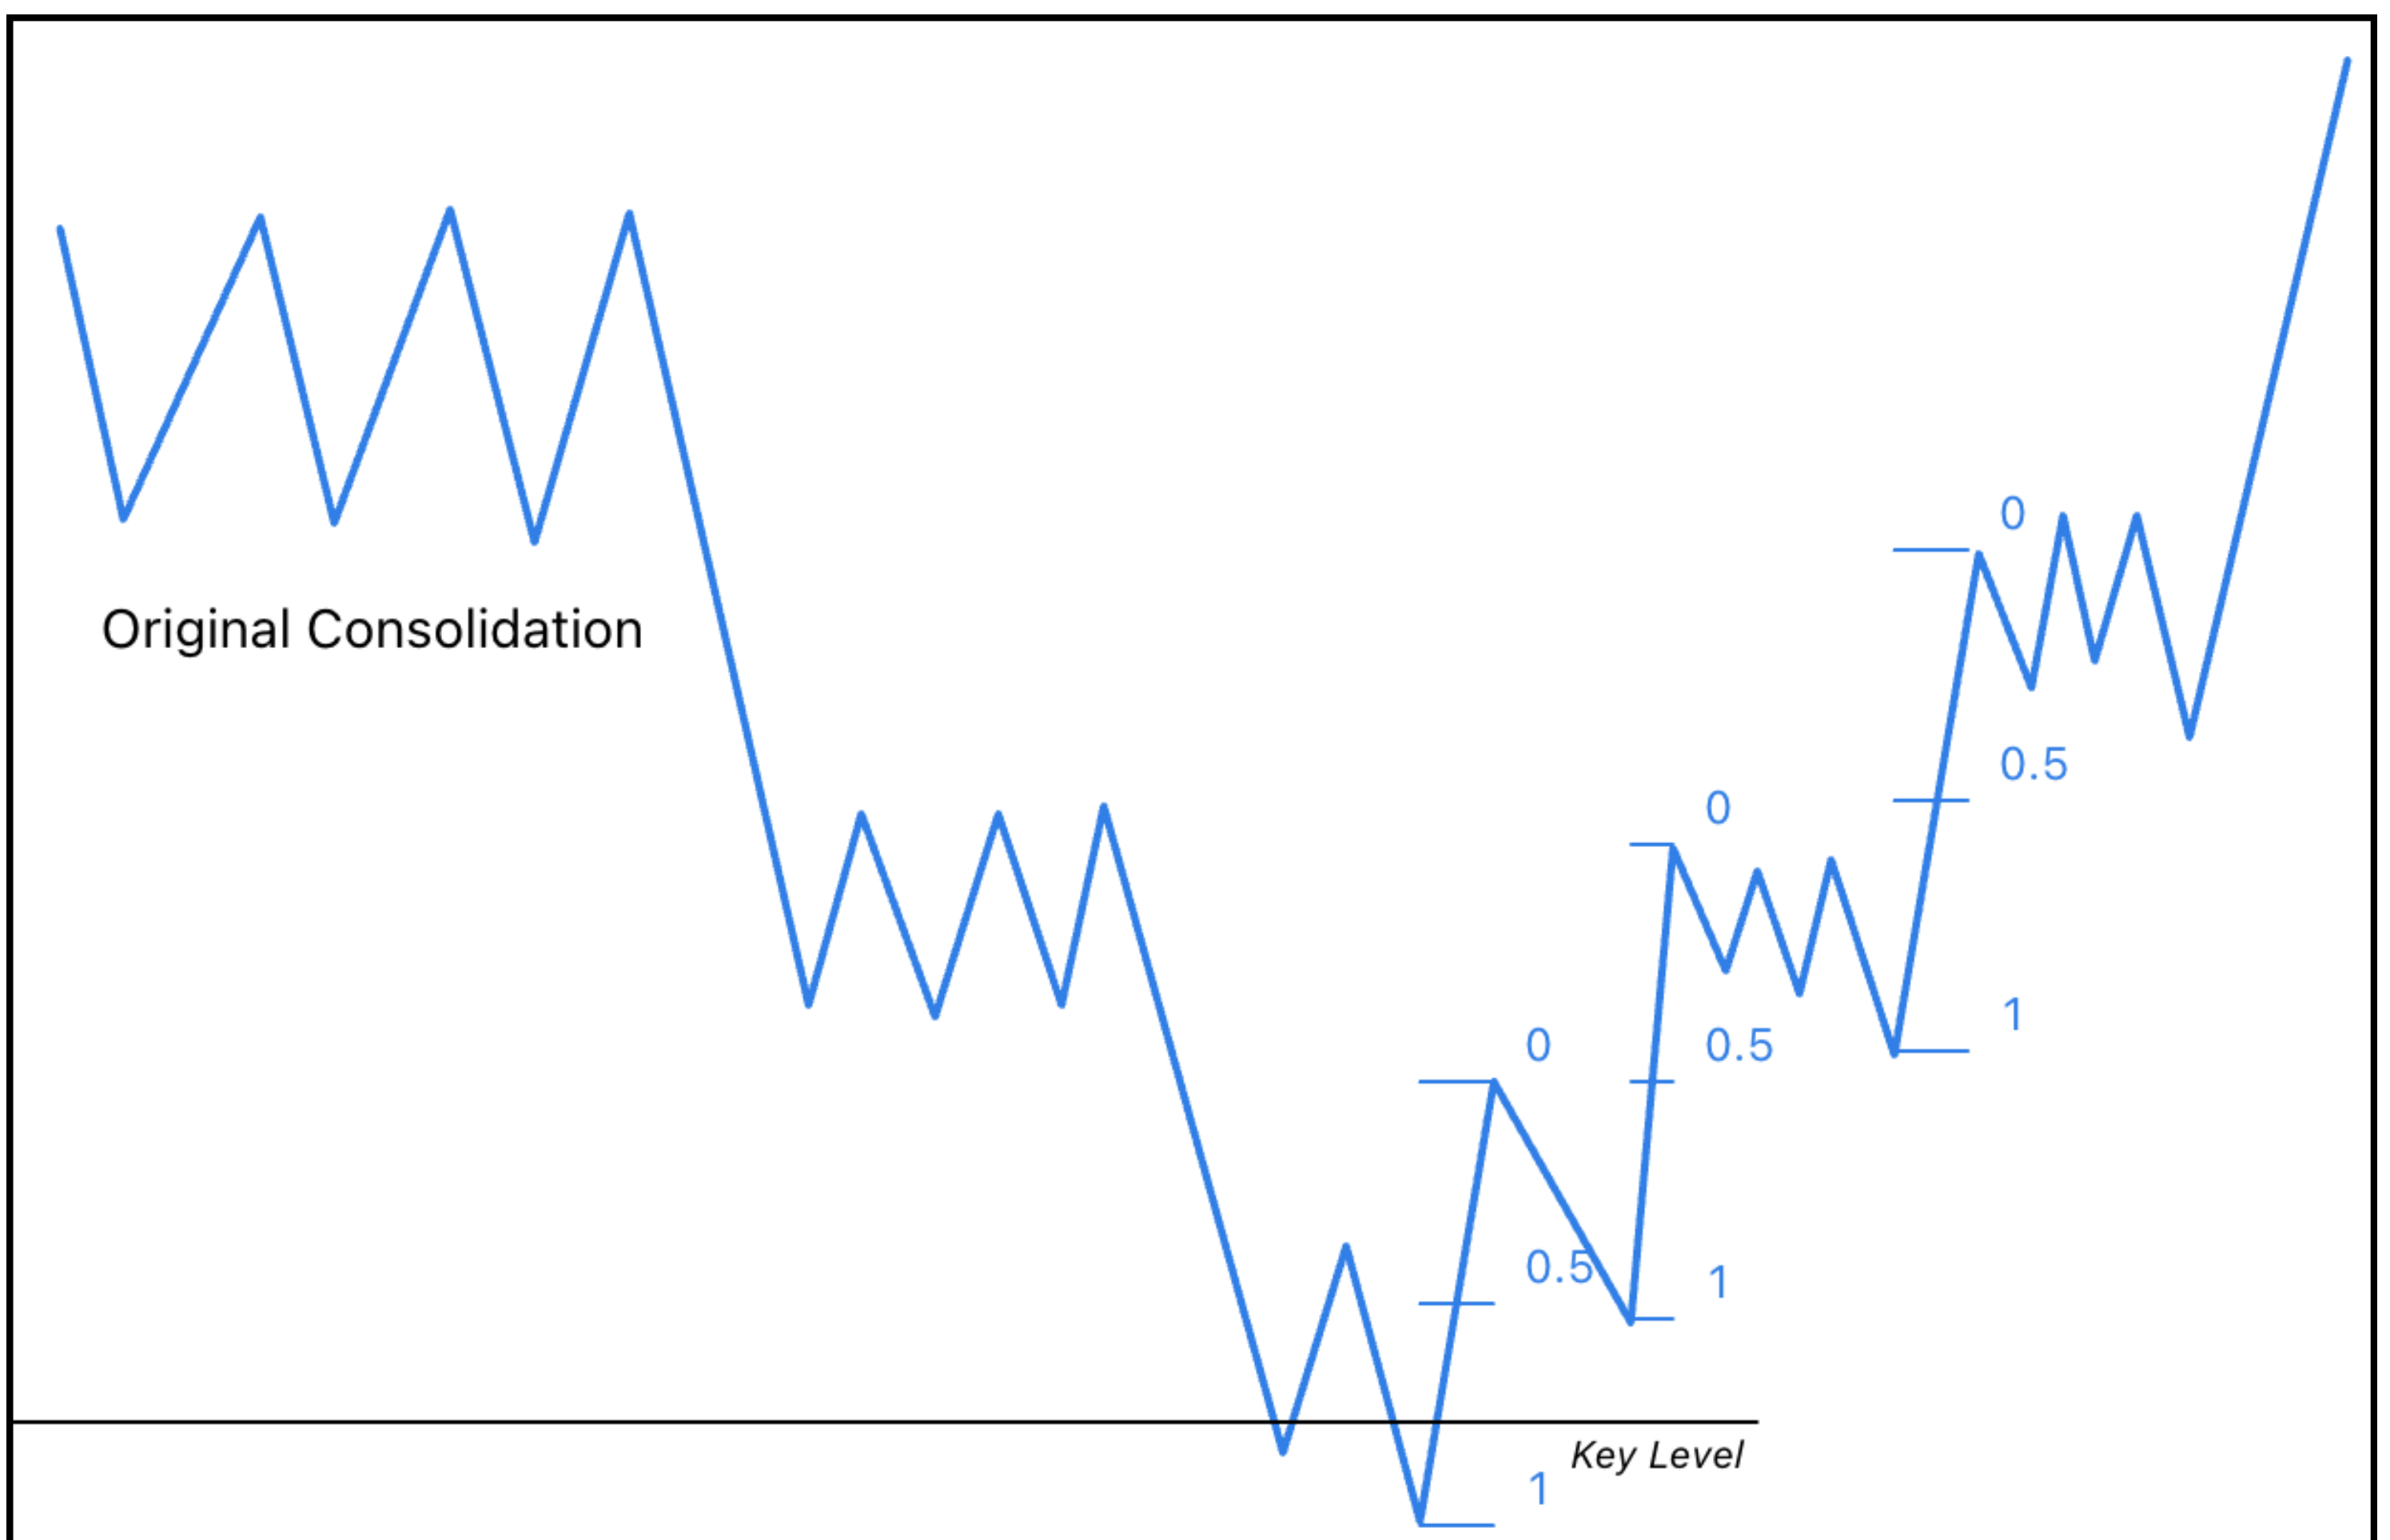

TARGETING

Pictured below is a market maker model. The key here is the narrative, or why would you expect a market maker model.

Price trading into a key level that is likely to cause a reversal gives a sound narrative of why there would be a market maker model.

See below for all of the impulses plotted on the chart that could have been traded using the range expansion strategy.

THANK YOU

Range Expansion Strategy

ANY QUESTIONS?

You most likely have questions about at least one of the topics discussed in this strategy.

Yes, this strategy is simple, but it requires you to properly implement each step as instructed for the highest probability.

It's easy to read this guide, but it's more difficult to execute in a live setting. This is ok and normal, so don't worry. There's even a term for it - "analysis paralysis".

To ensure the highest chance of success for you, I have opened up my calender for you to book a free strategy session.

In this session we will build a full trading plan and create a clear path from where you're at now to becoming a consistent trader who's capable of finding setups on their own.
